

RBAC Builder

Design RBAC policies visually. Deploy them instantly.

NEED HELP WITH

Demo video, eng
polish

In one sentence: An SA opens the builder, checks boxes in a permission matrix, and gets API-ready JSON, Terraform files, and a deployment ZIP — no manual JSON authoring, no guessing action names, no tribal knowledge required.

section("The Problem We're Solving")

Every enterprise customer needs custom RBAC. And every time, the SA faces the same struggle:

The Blank Page

"Who should get what permissions?"

The SA opens a Google Sheet, cross-references Terraform modules, looks up action names in source code, hand-writes JSON, and hopes the scoping is right. One typo means a broken deployment. Takes **2–4 hours per customer**.

No Health Visibility

Existing customers have orphaned roles, inactive users with elevated access, and no way to audit their posture. We can diagnose the problem (Policy Explorer) but there's no bridge to *"here's how to fix it."*

Keeping Up With the Product AI Configs added new actions in 2024–2025. Most SAs don't know they exist yet. The builder includes them natively, so SAs stay ahead.

section("How It Works")

Here's what the SA experience looks like, start to finish:

Setup

Design Matrix

Review & Deploy

1. SETUP

Enter customer name, project key, teams, and environments. Choose manual or connected mode (pull from the LD API).

2. DESIGN MATRIX

Check boxes in a spreadsheet-like grid: Teams × Permissions × Environments. Project-scoped and environment-scoped actions are clearly separated.

3. DEPLOY

Download API-ready JSON, Terraform HCL, or a delivery ZIP. Or deploy directly to LaunchDarkly with one click.

section("What the Builder Can Do")

Visual Permission Matrix

Instead of writing JSON by hand, the SA checks boxes. The matrix covers flag lifecycle, segments, experiments, AI configs, observability, approval workflows — everything. Critical vs. non-critical environments are handled automatically with tag-based scoping.

Sage — AI Role Designer

Not sure where to start? Describe the customer’s teams in plain English: “We have 4 teams, developers need targeting in test but only view in prod.” Sage (powered by Gemini) recommends a complete permission matrix with reasoning. Review it, tweak it, apply it to the grid with one click.

Multi-Format Export

The builder outputs whatever the customer needs:

- ✓ **API-ready JSON** — deploy custom roles and teams directly
- ✓ **Terraform HCL** — fits into infrastructure-as-code workflows
- ✓ **Delivery ZIP** — matches the standard SA delivery package
- ✓ **Direct API deploy** — push to LaunchDarkly from the UI

Policy Explorer (Companion)

A separate tool that connects to a customer’s existing account and shows the health of their RBAC: orphaned roles, inactive users with elevated access, role utilization rates. Explorer diagnoses, Builder prescribes.

section("Before & After")

section("The Journey So Far")

28 phases designed, 16+ implemented. Fully tested with unit tests, documented with architecture guides, and deployed on Streamlit Cloud.

section("Impact")

8x faster

Hours to minutes per customer RBAC delivery

Zero guesswork

Correct scoping, least-privilege, validated before deploy

Always current

AI Configs, observability, context kinds built in

Any SA can deliver

No more tribal knowledge — the tool knows the actions

Want to help? Looking for folks interested in SA tooling, AI-assisted workflows, or LaunchDarkly RBAC. Engineering help for API polish and a killer demo video would be amazing. Reach out to **@Arif Shaikh**.
